## **MeltDown™** CROP RESIDUE DIGESTER

This year's crop residue is hiding two valuable things:  
**Money and Nutrients**

But you can immediately begin reclaiming them. Start next season off right with Biodyne's biological solution to the stubble issue and get ready to see your ROI grow and your soil health improve.

**Meltdown™—it's the natural choice.**

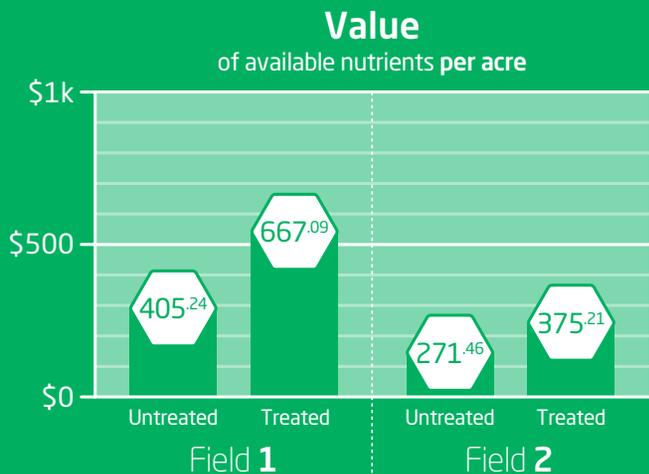

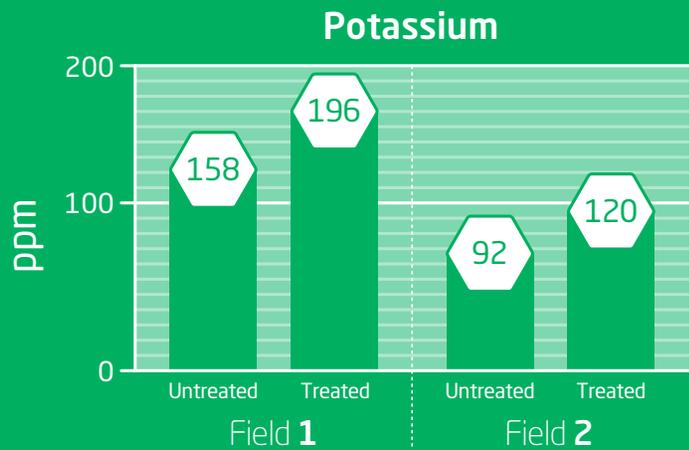

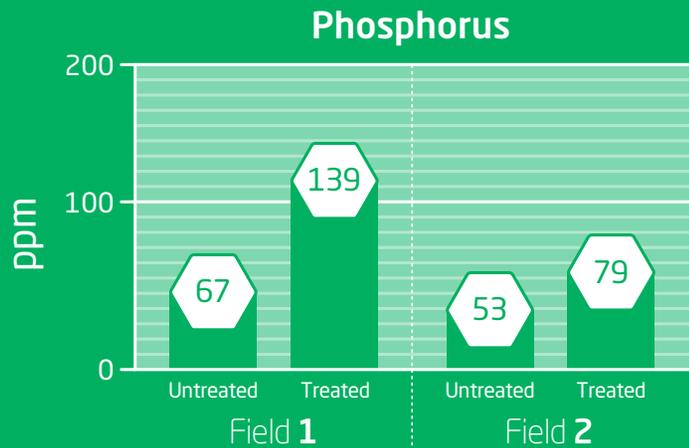

**Don't let your asset be your liability.**

There's nothing better than a good crop. Until it comes to residue. Then those strong stalks and stubble turn into a nuisance:

- Requiring extra field prep
- Wreaking havoc on your equipment
- Causing uneven planting
- Resulting in poor seed placement

What if you had a product that not only addressed these problems but also increased your yield potential for next year's crop?

## Proven nutrient release.

### Soil health and nutrient value with and without Meltdown™

These charts—which are based on tests conducted by an independent research firm—show the soil analysis of two fields that had areas treated with Meltdown™ and areas that were not. Each sample was evaluated for levels of phosphorous and potassium. Then, a monetary value was calculated for each sample based on the nutrients available. As you can see, some of the nutrients as much as doubled in the areas where Meltdown™ was applied, and the value increased by over **64%**.

## Accelerate nature's process.

Meltdown™ does just that. Our broadcast application of non-GMO 100% naturally-occurring microbes and other biostimulant technologies acts as a catalyst, stimulating the breakdown of residue.

As a result, the organic matter returns to the soil more quickly—reinvigorating and readying it for the following year's crop. In essence, your crop residue becomes the first fertilizer for next season. And that means you're reclaiming your money. On the other hand, if you have undigested residue in your fields, that's a physical tie up of your investment dollars.

## Meltdown™ benefits you, your crop and your land.

- Returns nutrients to the ground faster, improving soil health and increasing yield potential
- Acts as an affordable soil enhancer (\$10-12 per acre) that can be easily applied in fall or spring
- Diversifies soil makeup—including nutrients it may be deficient in, such as potassium and phosphate
- Releases more carbon for your crop, improving health and performance
- Breaks down crop residue naturally, which
  - simplifies ground prep for the upcoming season, perhaps even eliminating tillage passes
  - reduces hair pinning
  - makes it less likely tough stalks will damage equipment
  - allows better seed singulation, promoting stand optimization

## Meltdown™ application is simple.

- Effective for all types of crop residue
- Can easily be added to your existing fall or spring burndown
- Recommended dose of 32 ounces per acre
- Tank mix ready
